Expense Tracker v1.0: Business Requirements

Nov 8, 2026 · @Zayed

1. Overview

Expense Tracker is a small command-line app. The user enters a month's expenses one by one, and the app shows where the money went, category by category.

2. Business objectives

- Show users how much they spent in a month.
- Show which categories take the largest share of their money.

3. Users

Individuals who want to review their personal monthly spending in Taka (Tk).

4. Scope

In scope: recording expenses, totals by category, the overall total, and a printed report.

Out of scope: adding or deleting expenses after the report is shown, checking that the amount is a valid number, saving to a file or database, budgets, and a graphical interface.

5. Functional requirements

ID	Requirement	Details
FR-01	Enter expenses	Ask the user for item name, amount and category, one expense at a time. Stop when the user types "done" as the item name.
FR-02	Default category	If the user leaves the category blank, save the expense as "other".

ID	Requirement	Details
FR-03	Category totals	Group all expenses by category and add up each category.
FR-04	Overall total	Show the total amount spent in the month.
FR-05	Top category	Show the category with the highest spending and its amount.
FR-06	Report	Print each category, its amount and its share of the total in %.
FR-07	No expenses	If no expenses were entered, show "No expenses entered." instead of the report.

6. Technical requirements

- Python 3, standard library only.
- Store each expense as a dictionary inside a list.
- Write each requirement as its own function.
- Only the report function prints. Every other function returns its result.
- Functions get their data as parameters, never from outside variables.

7. Sample output

```
Item (or 'done' to finish): Biryani
Amount (Tk): 280
Category (leave blank for 'other'): food
Item (or 'done' to finish): Gift for friend
Amount (Tk): 500
Category (leave blank for 'other'):
...
Item (or 'done' to finish): done
----- Monthly Report -----
food: 2080 Tk (37%)
transport: 960 Tk (17%)
bills: 1500 Tk (26%)
shopping: 650 Tk (11%)
other: 500 Tk (9%)
--------------------------
Total: 5690 Tk
You spent the most on food: 2080 Tk
```

8. Acceptance criteria

- [ ] The app keeps asking for expenses until the user types "done".
- [ ] The report lists every category used, with the correct amount.
- [ ] The percentages add up to about 100%.
- [ ] An expense with a blank category appears under "other".
- [ ] Typing "done" straight away shows "No expenses entered." and does not crash.
- [ ] The app has been tested with at least 8 real expenses from one month.
